

* Air Pressure and Water Current

S-1: A fan or cooler can run round across a wheel of plastic or other material tool or functions as a fan runs by the pressure of air like a BP machine does, to check up the blood-disorder or high or low pressure of blood. It ~~would~~ ^{may} be like a windmill also.

S-2: Either it may be also another way to current ^{the} water of a water tank or it may be with help of a pump machine like motor cycle tube, and big vehicle tube like tractor tube and or other big air reserved tank to make run up the fan for or creating pressure.

the purpose of electricity of water as a dynamo of that makes the same current to run the wheel of plastic to run its attached ~~for~~ fan under water level in the well function of pipe in the under ground level of water to flow up the water upward of the face of tubewell or swallow tubewell or deep tube well also.

When these two systems functions together is, ^{the} ~~the~~ ^{air} ~~air~~ ^{of windmill or pump machine} ~~and~~ ^{the} ~~water~~ ^{of tank} up the high whose water can be reserved or fill up ~~by~~ with the current of water from that tank, then the systems generate automatically a nudder which has fan or fans to create electricity by help of both systems. If two systems can function well
